

Protect your car with

# GYEON QUARTZ CERAMIC COATING

NEW TECHNOLOGY!

Gyeon Quartz Coating is based on silicon dioxide (SiO<sub>2</sub>), which is the most sophisticated technology in car paint protection to date.

The Quartz Coating technology increases the hardness of a car's paint level to 9H, as well as its measurable thickness up to 1 micron.

Due to the thickness of the coating, all scratching and fading which may appear during washing or as a result of extensive exposure to caustic substances (like bird droppings), does not reach the paint – leaving the surface intact.

The coating is entirely resistant to chemical substances with a PH between 2 and 11 – which makes it incredibly durable and resistant to the effects of frequent washing. The only way to remove the coating is through the application of professional, intensive abrasives.

An additional benefit of the Quartz Coating is that it provides high clarity and transparency which leaves an extremely glossy finish to the paint.
